

Gary Dobkin - Customer Success + AI Operations Proof Brief

Contact: Menorca, Spain | gary@paput.ai | [linkedin.com/in/gvbd](https://www.linkedin.com/in/gvbd) | github.com/illmethinks0 | paput.ai

The Problem I Solve

Customers do not adopt what they cannot implement quickly. AI makes this harder when companies add tools without changing workflows, ownership, review gates, evidence, training, or operating cadence.

My work sits at that intersection: customer success leadership, technical onboarding, security deployment, internal automation, and production AI workflows. I build AI-enabled operating systems that make adoption measurable, reviewable, and repeatable.

Proof From Customer Success & Deployment

Perch Security - Founding VP of Customer Success

- Built the customer success function from scratch during startup scaling.
- Achieved 1.7% monthly gross logo churn through acquisition, measured from billing-system data reconciled in the ARR bridge and visible in cohort tables, backed by 96% CSAT and 97% NPS.
- Scaled the customer success team to 12 and managed 5 direct reports.
- Created operating cadence, SCRUM-style execution, customer health workflows, onboarding/support/product feedback loops, and Slack/Zapier automation.
- Maintained delivery through COVID disruption using process redesign, remote delivery paths, and hands-on leadership.

ConnectWise - Director of Global Security Onboarding

- Led 26-person global security deployment/onboarding organization across US, EMEA, and APAC.
- Delivered 200+ security projects per month across SIEM, IDS/IPS, EDR/MDR, incident response, and security operations tooling.
- Reduced customer time-to-value to under 30 days through readiness checks, deployment playbooks, handoff redesign, escalation paths, and operational automation.
- Managed an 18-person international IDS deployment/support team.
- Delivered customer satisfaction, backlog, SLA, risk, and performance reporting to executive leadership and the board.
- Built a billing/contract audit workflow tied to deployed security services that identified \$1.575M in unrealized annual contract value.

Proof From AI Operations

Paput.ai / EUCompli.ai

- Built AI workflow patterns for customer operations, support triage, sales/CRM follow-up, service operations, compliance scanning, evidence capture, founder workflows, and approval-aware internal operations.
- Created production AI controls with structured outputs, durable task state, traceable execution, human review gates, telemetry, audit trails, and repeatable validation loops before external action.

- Built EUCompli.ai from concept into a Rails 8 compliance platform for GDPR and EU AI Act workflows with PostgreSQL, Solid Queue, authentication, authorization, MCP transport, audit logs, and deployment-ready architecture.

Why It Matters For AI Transformation

AI transformation is not mainly a tooling problem. It is an adoption, workflow, trust, and operating-system problem.

I bring:

- **Customer empathy:** 15+ years building systems around real support, onboarding, retention, and implementation pain.
- **Operating discipline:** metrics, health workflows, playbooks, QBR/exec reporting, escalation paths, and delivery cadence.
- **AI operating fluency:** workflow automation, production AI controls, structured outputs, durable task state, approval gates, telemetry, validation loops, and evidence capture.
- **Founder ownership:** ability to work without perfect structure and turn ambiguity into shipped systems.

Best Fit

I am most useful where a company needs AI adoption to become operational reality: clear workflows, measurable outcomes, accountable owners, fast time-to-value, and systems that help customers or internal teams actually change behavior.
