

Gary Dobkin - Production Agent Systems Proof Brief

Use with: AI startup leadership, Head of Engineering - AI Stack, CTO/co-founder, forward-deployed AI, agent systems, AI compliance/security platform roles **Resume:** `Gary Dobkin Resume - AI CURRENT.pdf`

Contact: Menorca, Spain | gary@paput.ai | linkedin.com/in/gvbd | github.com/illmethinks0 | paput.ai

THE PROBLEM I SOLVE

Most AI products fail in production because they stop at prompts and demos. Real business workflows need state, contracts, tool boundaries, validation, observability, approval gates, and evidence that can survive customer, compliance, and executive scrutiny.

My work is focused on building that layer: production agent systems that execute narrow roles, return structured outputs, preserve traceability, and stay useful when workflows become messy.

WHAT I BUILT

Paput.ai / EUCompli.ai - A Rails 8 compliance and AI workflow platform for GDPR and EU AI Act domains.

- Built a working Rails 8 control plane with PostgreSQL, Solid Queue, Rodauth/JWT/API-key auth, Pundit authorization, MCP transport, API documentation, audit logs, and Render deployment posture.
- Built quick/full scan flows with subscription gates, structured phase outputs, persisted findings, regional records, compliance tests, implementation records, telemetry, and Langfuse-backed observability.
- Designed production agent workflows with narrow roles, schema-bound outputs, traceable tool calls, deterministic tests, visible state, cost tracking, watchdog jobs, evidence bundles, and human approval gates.
- Built internal operator workflows for support, sales, CRM, evidence capture, recovery, and approval-aware AI operations so the product work stayed tied to real business execution.
- Designed the path from Rails/Solid Queue orchestration into Firecracker-backed isolated compute for heavier analysis workloads, higher scan volume, and concurrent agent execution while preserving contracts, state, validation gates, monitoring, and reporting.

WHY IT MATTERS

This is not "AI wrapper" work. It is the operating architecture behind AI systems that need to be reliable, reviewable, and deployable:

- **State:** durable task and phase state instead of one-off prompt execution.
- **Contracts:** structured outputs and predictable handoffs between agents, tools, and humans.
- **Evidence:** persisted artifacts, audit logs, compliance records, and explainable findings.
- **Controls:** approval gates, risk gates, subscription gates, watchdogs, and recovery checkpoints.
- **Observability:** telemetry, queue visibility, costs, stale job detection, and runtime metrics.
- **Deployment posture:** container/cloud deployment today, isolated compute path for heavier workloads.

RELEVANT LEADERSHIP CONTEXT

- Founded and exited a 12-year MSP serving 50+ HIPAA-sensitive veterinary hospitals with under 1% churn.
- Built customer success at Perch Security through acquisition, reaching 1.7% churn, 96%+ CSAT, and 97% NPS.
- Directed 26-person global security deployment operations at ConnectWise across SIEM, IDS/IPS, EDR/MDR, US/EMEA/APAC, and 200+ monthly projects.

BEST FIT

I am most useful where a company needs someone who can define the product, build the first reliable system, operate directly with customers, and turn AI from a prototype into a governed workflow platform.
